

# Overall Product Report

## Inventory, Purchasing, Sales & POS Management System

**Prepared for:** Product/Design Team **Scope reviewed:** Dashboard, Catalog (Brands, Categories, Products, Units), Inventory (Stock Adjustments, Stock Movements/Ledger, Stock Transfers, Stock Levels, Warehouses), Purchasing (Purchase Orders, Suppliers), Sales (Customers, Sales Orders), Administration (Roles & Permissions) **Date:** August 8, 2026

---

### 1. Executive Summary

What exists today is a well-built **back-office inventory, purchasing, and sales management system**. The Catalog, Inventory, and Purchasing modules are consistent, well modeled (hierarchical categories, a genuinely strong stock ledger with audit trail, a real state machine on stock transfers), and the Roles screen shows a properly granular permission matrix (per-module View/Create/Edit/Delete/Export).

What it is **not yet** is a Point of Sale system, or a complete modern business platform. There is no checkout screen, no barcode scanning, no payment capture, no invoicing/printing, no reports module, no settings, and no dashboard that surfaces the business at a glance the way a 2026-era product should. This report lays out everything missing, what to add, and where to take the product further than what was asked for.

| Category                                         | Count |
|--------------------------------------------------|-------|
| Missing core features                            | 20    |
| UX / consistency issues                          | 13    |
| Dashboard bento-grid cards to design             | 20    |
| POS features to build                            | 24    |
| Barcode / QR / label printing items              | 9     |
| Invoicing, payments & messaging items            | 20    |
| Reports module items                             | 7     |
| Manual/guide, language, mobile, light-mode items | 18    |

| Additional 2026-grade suggestions    | 11         |
| <b>Total design/build items</b>      | <b>154</b> |

---

## 2. What Already Works Well

- Consistent list-page pattern across every module: breadcrumb → title → action button → search/filter/columns → table → pagination
  - Good hierarchical data modeling (Categories has Parent category, Products link Brand/Category/Unit)
  - Stock Movements (ledger) is a strong audit trail — type, quantity delta, balance-after, note, actor
  - Stock Transfers has a real state machine (pending → completed) with an inline "Complete transfer" action
  - Purchase Orders distinguish order status from payment status — good foundation for accounting
  - **Roles & Permissions is genuinely well built** — a real per-module matrix (Brand, Category, Customer, Product, Purchase Order, Sales Order, Stock Adjustment, Stock Movement, Stock Transfer, Stock Level, Supplier, Unit, User, Warehouse, Role) with View/Create/Edit/Delete/Export granularity, and sensible presets (Super Admin 184 permissions, Manager 56, Staff 34)
  - "Create & create another" pattern on forms is a nice touch for bulk data entry
  - Reorder level / low-stock threshold already exists on the product model
- 

## 3. Missing Core Features

1. **No POS/checkout screen.** Sales Orders is a back-office form (dropdown-based product selection), not a fast counter transaction flow.
2. **No payment capture** — "Payment status" is a static badge with no action to record a payment or select a tender type.
3. **No barcode/QR scanning anywhere** — the Barcode field exists on the product form but nothing reads it, not in Sales Orders, Stock Adjustments, or Stock Transfers.
4. **No receipt or invoice generation** — no print, PDF, or email output for a sale or PO.
5. **No reports/analytics module** beyond the dashboard chart.
6. **No Settings module** — currency, tax defaults, business profile/logo, receipt template, default warehouse, printer setup.
7. **No "receive stock against PO" screen** — PO shows "partially\_received" with no visible workflow for recording what arrived.

8. **No returns/refunds workflow** on Sales Orders or Purchase Orders.
  9. **No supplier payments/accounts payable tracking.**
  10. **No customer statement/ledger** — balance owed, credit limit, payment history.
  11. **No discounts/promotions engine** — a Discount total field exists but no way to apply it.
  12. **Product images don't render** — the Image column is present but empty on every product row.
  13. **No product variant management UI** — "Has variants" toggle exists, and variant SKUs appear in Stock Levels (e.g. `SKU-00025-S`), but there's no screen to manage the size/color matrix.
  14. **No global search** across products, orders, and customers.
  15. **No notifications center** — low-stock is a single dashboard number with no click-through or digest.
  16. **No bulk actions** — row-selection checkboxes exist everywhere but no visible bulk-edit/deactivate/export bar appears.
  17. **No export (CSV/PDF)** from any table.
  18. **No audit/activity log** beyond the stock ledger.
  19. **No multi-warehouse transfer suggestions** — no "suggested transfer"/rebalancing logic despite split stock across warehouses.
  20. **No user profile management** — no obvious place to change password/avatar/notification preferences.
- 

## 4. UX / Consistency Issues

1. Product list "Image" column renders empty for every product.
2. No visible bulk-action bar despite row-selection checkboxes.
3. Filter icon (funnel) appears everywhere but its behavior isn't confirmed to open a real filter panel.
4. Status badge color system needs a documented palette — "correction/applied/pending/completed/draft/confirmed/received/partially\_received/order d/paid/unpaid" overlap in color (blue used for both links and statuses).
5. Table sort indicators are inconsistent — some columns show chevrons, some don't, with no clear rule.
6. "Reserved" column in Stock Levels always shows 0 across visible rows — confirm this is wired up.
7. Warehouse "Is default" uses a check/X pattern that reads like a status rather than a settable action.
8. Purchase Order and Sales Order both compute totals manually with no live preview as items are added.
9. Low text contrast on muted labels (dashboard stat labels, secondary table text) — likely under WCAG AA.
10. Inconsistent icon weights across sidebar sections.

11. Pagination pattern is solid but inconsistent — some lists show page numbers, others don't.
  12. Default "Per page" of 10 is very low for high-volume tables (Stock Movements: 134 results).
  13. Sales Order has both a status dropdown and a separate "Confirm order" row action — unclear which is the source of truth.
- 

## 5. Dashboard — Full Feature List (Bento Grid)

A bento grid means modular cards of varying size on one screen — the most important data claims more space, without a separate page. Card inventory to design:

**Large/hero cards:** Today's sales with live counter + comparison vs. yesterday; Revenue trend chart with Day/Week/Month/Year toggle and period-over-period overlay.

**Medium cards:** Stock health (active/low/out + total value); "Needs your attention" unified card (unpaid invoices, POs awaiting receipt, draft orders, pending transfers); Top products ranked list; Top customers ranked by spend; Payment method breakdown (donut); Staff/cashier performance; Warehouse comparison.

**Small stat cards:** Active products, low stock count, today's orders, average order value, new customers this week, currency ticker (if multi-currency).

**Utility cards:** Quick actions launcher (New sale / New PO / Add product / Adjust stock); Recent activity feed combining sales/adjustments/PO changes; System notices (sync status, backup status, subscription renewal).

**Personalization:** Drag-to-rearrange grid saved per role (Admin vs. Cashier vs. Warehouse staff); global date-range picker filtering every card at once.

**= 20 dashboard cards**

---

## 6. POS System — Full Feature Set

**Sale screen:** product grid with category tabs + instant search; persistent barcode scanner input (keyboard-wedge and camera-based); cart with qty steppers, per-line discount, void; quick customer select or "Walk-in" default with on-the-fly new customer creation; hold/park sale; manager-PIN price override; real-time stock check on scan.

**Payment:** gateway integration (card terminal/tap-to-pay, online gateway, QR-code pay); cash drawer with change calculation; split tender; store credit/gift card redemption; partial payment tracked on customer ledger.

**Invoicing & printing:** automatic invoice numbering; A4 PDF invoice and POS thermal receipt (58/80mm) templates; barcode/QR sticker printing from the sale screen or catalog; digital send via email/SMS/WhatsApp as default, print as opt-in; reprint/resend any past invoice.

**Till & shift management:** opening float, cash-in/out logging, end-of-shift reconciliation, X-report and Z-report.

**Resilience & speed:** offline mode (PWA) queuing sales locally; keyboard shortcuts; optional customer-facing second display.

**Advanced/optional:** self-checkout kiosk mode; loyalty points accrual/redemption at checkout.

**= 24 POS features**

---

## 7. Barcode, QR & Label Printing

1. Auto-generate barcode from SKU, or accept manual entry
2. Visual barcode/QR preview on the product page, not just raw text
3. Support Code128, EAN-13, and QR in one label designer
4. Drag-and-drop label template designer sized to common label stock (40×30mm, 50×25mm etc.), saved as reusable templates
5. Bulk print from product list — select rows → "Print labels" → template + quantity per SKU
6. Print directly to dedicated label printers (Zebra/Brother/DYMO-class), separate from A4 printers
7. QR-only mode for traceability/batch-lot linking where a barcode isn't practical
8. Scanner input integration everywhere a product is selected (POS, Stock Adjustments, Stock Transfers, PO receiving)
9. Duplicate-barcode validation on product creation

**= 9 barcode/QR/label items**

---

## 8. Invoicing, Payments & Messaging

**Payment gateways:** pluggable connector layer (Stripe/PayPal/regional gateways) rather than hardcoded to one provider; in-person card terminal integration; QR-code payment; online

payment links on digitally-sent invoices; automatic reconciliation when a gateway payment clears; refund-through-gateway support.

**Automatic invoice numbering:** configurable prefix/date-segment/sequence format; choice of reset rule (never/yearly/monthly/per-warehouse); atomic server-side counters to guarantee no gaps or duplicates across concurrent POS terminals; separate series for Invoices vs. POs vs. Credit Notes.

**Invoice customization:** template editor for A4 PDF (logo, tax breakdown, payment terms) and POS thermal receipt (compact, QR to digital copy); customizable logo/colors/footer message; multi-currency aware formatting; multiple saved templates per branch or retail/wholesale.

**Send via messaging platforms:** WhatsApp Business API send (PDF/image); SMS and email fallback; one-click "Send" from any completed order; delivery status (sent/delivered/read); customizable message templates with variables.

**= 20 items**

---

## 9. Reports Module

Sales reports (by day/week/month, product, category, customer, staff); Inventory reports (valuation, aging/slow-movers, movement export); Purchasing reports (spend by supplier, on-time delivery, outstanding POs); Tax reports (collected by period, exportable for filing); Profit & loss (margin by product/category); Customer reports (repeat rate, AOV, top spenders, outstanding balances); every report exportable to PDF/CSV/Excel and schedulable as an automatic email digest.

**= 7 report types**

---

## 10. Manual/Guide, Multi-Language, Mobile & Light Mode

**In-app manual/guide:** contextual "?" help per screen; full written onboarding guide (Catalog → Inventory → first PO → first Sale → Reports); interactive setup checklist with progress tracking; searchable knowledge base with screenshots/short videos; in-context tooltips on complex fields.

**Multi-language:** full i18n UI translation layer; language switcher persisted per user; RTL layout support; translated invoice/receipt templates independent of staff UI language; admin-editable translation strings.

**Mobile & tablet:** POS screen must be tablet-first, not a shrunk desktop layout; responsive back-office reflowing tables into cards on mobile; 44px+ touch targets; installable PWA/mobile

app for owners to check dashboard and approve POs on the go; explicit testing at phone/tablet-portrait/tablet-landscape breakpoints.

**Light mode:** a true light theme with its own contrast tuning, not an inverted dark palette; auto theme switching by system preference or time of day with manual override; light-mode-specific styling for status badges, charts, and receipt previews.

= 18 items

---

## 11. Accessibility & Sustainability

**Inclusive design:** WCAG AA contrast fixes; status meaning never relies on color alone (pair with icon/label); full keyboard navigation with visible focus states; screen-reader labels on icon-only controls; adjustable text size; large touch targets in POS mode specifically; multi-language support (also listed in §10); clear empty/error states with guidance and a direct action; undo on destructive actions instead of only a confirm dialog.

**Sustainability:** paperless-by-default receipts/invoices (email/SMS/QR-code as primary, print as opt-in); batch/consolidated label printing instead of one-off prints; lightweight data loading (lazy images, no default full-table exports) to reduce data transfer and server energy draw, benefiting slow/metered connections too — the existing dark theme already helps here for OLED power draw during long POS shifts.

= 12 items

---

## 12. Additional Suggestions — Beyond What Was Asked

- **AI-assisted reordering** — suggest PO quantities from sales velocity and lead time instead of a static reorder level
- **Demand forecasting** — trend-based "you'll run out of X in 9 days" alerts
- **Multi-branch/franchise support** — consolidated reporting with per-branch permission scoping
- **E-commerce sync** — keep stock and orders in sync with an online store
- **Expense tracking** — rent, utilities, wages, for a real P&L beyond sales/COGS
- **Data import/export wizard** — CSV bulk onboarding with column mapping and validation preview
- **Automated backups + one-click restore**, surfaced on the dashboard's system notices card
- **Webhook/API access** for businesses wanting to connect their own tools
- **Two-factor authentication/biometric login** on mobile

- **Customer self-service portal** — view order history, download past invoices without contacting the business
- **Subscription/recurring invoices** for standing B2B orders

= 11 suggestions

---

## 13. Priority Order

1. **POS checkout screen + barcode scanning** — the single biggest gap between this and an actual point-of-sale product
  2. **Payment capture + invoice/receipt generation + printing** — completes the sales loop
  3. **Stock receiving screen** for Purchase Orders
  4. **Reports module**
  5. **Settings** (tax, currency, receipt/invoice templates, business profile)
  6. **Barcode/QR generation & label printing**
  7. **Messaging integration** (WhatsApp/SMS/email invoice sending) and **payment gateway integration**
  8. **Accessibility pass** (contrast, keyboard nav, color-blind-safe badges) — cheap to fix, high impact
  9. **Dashboard bento-grid redesign + light mode + mobile/tablet responsiveness**
  10. **Bulk actions, export, global search, notifications**
  11. **Manual/guide system + multi-language**
  12. **Everything in §12** — the 2026-grade extras that make it competitive, not just complete
- 

## 14. Summary Table

| Category                        | Count |
|---------------------------------|-------|
| Missing core features           | 20    |
| UX/consistency issues           | 13    |
| Dashboard bento-grid cards      | 20    |
| POS features                    | 24    |
| Barcode/QR/label printing       | 9     |
| Invoicing, payments & messaging | 20    |
| Reports module                  | 7     |

|                                            |            |
|--------------------------------------------|------------|
| Manual/guide, language, mobile, light-mode | 18         |
| Accessibility & sustainability             | 12         |
| Additional 2026 suggestions                | 11         |
| <b>Total design/build items</b>            | <b>154</b> |

This is the complete picture: the back-office foundation is strong, and the fastest path to a real, sellable POS is a dedicated checkout screen with barcode scanning and payment capture, writing into the stock ledger that's already well built — everything else in this report builds out from that core.
